Subject: **A nerd built an acoustics tool for hunters. Care to test it?**

Hey [Name],

I'm going to be completely straight with you: I'm not a professional hunter. I'm a programmer who works hard physical labor jobs to pay the bills, and I spend the rest of my time at a keyboard writing code (and yeah, probably smoking a little weed while I do it).

But while observing the tech available in the hunting space, I noticed something crazy. You guys have satellite mapping, advanced wind tracking algorithms, and hyper-realistic decoys... but when it comes to practicing calls, people are still just blowing into a hunk of acrylic in their trucks and guessing if they sound right.

As a nerd, I saw that as an acoustics problem. And I love acoustics problems.

So, I built **Outcall**.

I took the exact same real-time audio frequency analysis algorithms that professional audio engineers use and packed them into a mobile app. You play a master reference track from our library, blow your call into your phone's mic, and the app physically maps your waveform against the real animal in real-time.

It grades your cadence, your pitch, and your volume. It is brutal, and it tells you exactly where your mechanics are off, purely based on hard acoustic data.

We are going into a closed Alpha immediately, and I want to give lifetime, unlocked access to a few people in the community whose opinions actually carry weight.

I'm not asking for a sponsor plug or a shoutout. I just want you to try it, try to break it, and tell me directly if a nerd actually managed to build something genuinely useful for the woods.

If you're willing to take a look, reply to this email, and I'll send over a download link right now.

Either way, keep up the great content and good luck this season.
