Subject: **I built this engine between shifts. I need someone who actually knows the woods to break it.**

Hey [Name],

I'm not going to try to sell you anything right now, because frankly, I don't have the energy for marketing bullshit.

I'm a programmer by trade, but I spend my days busting my ass doing hard physical labor just to keep the lights on and pay the bills. When I get home, smelling like sweat and dirt, knowing my body is wrecked for the day, I pack a bowl, sit down at my keyboard, and I build things.

I wouldn't call myself a master woodsman. But I know audio processing. And watching guys sit in their trucks blowing into acrylic tubes, listening to YouTube videos, and just guessing if they sound like a mallard or a bull elk bothered the hell out of the nerd in me. Why the fuck are we guessing when we can measure it?

So over the last year, between shifts and late nights, I built an acoustics engine. It's called **Outcall**.

I took the raw frequency analysis algorithms used by audio engineers and mapped them to a mobile app. You play a master reference track of a real animal, blow your call into your phone, and it physically maps your waveform against the real thing. It grades your pitch, your cadence, your sustain. It doesn't care about your ego; it just reads the data to tell you exactly where your mechanics suck.

I'm starting a closed Alpha. I don't want your money, and I'm not asking for a shoutout or a sponsor plug on your channel.

I just need someone who actually knows what the hell they're doing to test this thing. I need you to break it. I need you to tell me where my acoustic model fails in the real world, and tell me if all the late nights building this exhausted out of my mind were actually worth it.

If you're down to give a tired programmer some brutal, honest feedback, reply and I'll send you lifetime unlocked access right now.

Thanks for your time, man. Keep up the videos.

[Your Name]

The guy behind Outcall
